

ABSTRACT OF THE DISCLOSURE

500  
32

An information apparatus is constructed for notifying output information to a remote terminal in response to an input signal of a sound. In the information apparatus, a first memory block memorizes characteristic data representing characteristics of various sounds. A second memory block memorizes various items of output information in correspondence to the characteristic data of the various sounds such that each item of the output information is associated to each sound. An input device collects a sound to provide an input signal of the collected sound. An analyzer device extracts characteristic data from the input signal of the collected sound. A controller device operates according to the extracted characteristic data for addressing the first memory block and the second memory block to identity the item of the output information corresponding to the collected sound. A transmitter device transmits the identified item of the output information to the remote terminal. A new sound and a corresponding item of output information can be registered for updating the first memory block and the second memory block such that the analyzer device extracts new characteristic data from the new sound. The controller device registers the extracted new characteristic data into the first memory block and registers the corresponding item of the output information into the second memory block.
